

pH in Brewing

Leon van der Linden

June 2025

Scope: pH

- What it is...
- Why you should care...
- How to measure it and look after your probe.

What is pH?

- $\text{pH} = -\log_{10}([\text{H}^+]) = -\log_{10}([\text{H}_3\text{O}^+])$
- In range 1-14
- Neutral $\text{pH} = 7$
- Basic (more OH^- than H^+) range 7 – 14
- Acidic (more H^+ than OH^-) range 7 – 1
- Critical to note the log scale!

$[\text{H}_3\text{O}^+]$ (M)	$[\text{OH}^-]$ (M)	pH	pOH	Sample Solution
10^1	10^{-15}	-1	15	
10^0 or 1	10^{-14}	0	14	← 1 M HCl acidic
10^{-1}	10^{-13}	1	13	
10^{-2}	10^{-12}	2	12	← gastric juice ← lime juice
10^{-3}	10^{-11}	3	11	← 1 M $\text{CH}_3\text{CO}_2\text{H}$ (vinegar) ← stomach acid
10^{-4}	10^{-10}	4	10	← wine ← orange juice
10^{-5}	10^{-9}	5	9	← coffee
10^{-6}	10^{-8}	6	8	← rain water
10^{-7}	10^{-7}	7	7	← pure water neutral
10^{-8}	10^{-6}	8	6	← blood ← ocean water ← baking soda
10^{-9}	10^{-5}	9	5	
10^{-10}	10^{-4}	10	4	
10^{-11}	10^{-3}	11	3	← Milk of Magnesia
10^{-12}	10^{-2}	12	2	← household ammonia, NH_3
10^{-13}	10^{-1}	13	1	← bleach
10^{-14}	10^0 or 1	14	0	← 1 M NaOH basic
10^{-15}	10^1	15	-1	

Why you should care! #1

pH in the mash: Ideal mash pH range (5.2-5.6) for optimal enzyme activity.

Beta-Amylase	131 °-150 °F	5.0-5.6	This rest works well at 153 °F as a compromise for beta and alpha rests. Creates small sugar chains that are highly fermentable and leaves the lowest finished gravity and lightest body. One of the diastatic enzymes required for saccharification.
Alpha-Amylase	149 °-162 °F	5.3-5.8	Produces glucose, maltose and un-fermentable dextrins. Leaves the highest finished gravity and fuller body. Can be slower to work than beta-amylase. Most active at 158 °F.

Why you should care! #2

pH in the kettle

- pH influences hop bitterness extraction.
- Impact on protein coagulation and therefore beer clarity.
- Impacts flavour balance and mouthfeel.

Why you should care! #3

pH During Fermentation

- Yeast thrives in a slightly acidic environment (pH 4.0-4.5).
- Impact on yeast health and fermentation efficiency.
- Affects final beer stability and microbial resistance.

Why you should care! #4

pH in Finished Beer

- Typical pH ranges for different beer styles
 - Sour beers ~3.0
 - Lagers ~4.2 – 4.6
 - Ales ~ 3.8 – 4.6
- Affects taste, mouthfeel, and foam stability.
- Consistency in brewing.

What does my pH probe do?

- Measures electrical potential (voltage) between electrodes (2,5) on different sides of a (fragile) glass membrane (1)
- The voltage depends on:
 - H⁺ activity in sample
 - Age / depletion of electrolyte (3)
 - Junction potential – grime (7)
- Includes a temperature probe for Automatic Temperature Compensation (ATC)

How do I use it and care for it?

- Before calibration
 - Check in pH = 4.0 buffer
 - Check in pH = 7.0 buffer
- IF required, calibrate with 7.0 and 4.0
- Cool your sample!
 - Accurate readings
 - Care for your membrane
- Remove and rinse, ASAP
- Blot to dry, no tapping, or shaking!
- Store moist or in 'storage solution' (3M KCl)

Is my probe broken?

- Did it dry out completely?
- Is it refillable?
- Did you drop it?
- Is your junction blocked up?
 - ➔ Junction potential test!
